

Anue Systems Provides an Automated Security Incident Remediation Solution for HP ArcSight ESM

Monitoring switch automates packet capture to speed root cause analysis

Washington D.C. – September 13, 2011 – [Anue Systems](#), the leading provider of network monitoring switches, will demonstrate its incident remediation solution that automatically captures packets from security events identified by HP ArcSight Enterprise Security Manager (ESM) at this week's HP Protect 2011 conference in Washington, D.C.

The automation capability of the [Anue Net Tool Optimizer™](#) complements the ability of the ArcSight solution to detect, analyze and respond to security threats. If ArcSight ESM detects an anomaly, it can manually or automatically trigger Anue NTO™ to send the right network traffic to a forensic recorder or other security probe.

The Anue NTO and HP [ArcSight ESM](#) solution together help companies to:

- Speed up root cause analysis
- Eliminate time consuming manual steps
- Simplify compliance

“Threats can be more effectively and quickly resolved with the right packet information,” said John Delfeld, director of business development for Anue Systems. “By combining ArcSight’s powerful security monitoring and threat detection with Anue’s automated packet capture we ensure the right traffic is sent to the right tools at the right time. This ensures that your forensic recorders, malware protections systems and data loss prevention appliances are receiving the data they need to mitigate the threat.”

“The Anue solution allows customers to capture and access packets associated with threats identified by ArcSight ESM,” said Dan Barahona, vice president of business development, HP ArcSight. “This extends user incident remediation capabilities and leverages customers’ existing forensic recorder and security appliance investments.”

The Anue NTO network monitoring switch resides in data centers between network SPAN ports or TAPs and the security and monitoring tools. The NTO provides complete network visibility by aggregating, filtering and replicating traffic so that all tools get the necessary data. The automation capabilities of the Anue NTO help companies to get the most from their security and monitoring tools.

About Anue Systems

Anue Systems ([anuesystems.com](#)) creates products that help network engineers monitor and test complex networks. The Anue Net Tool Optimizer increases network visibility, improves monitoring tool performance and eliminates TAP and SPAN port shortages by replicating, filtering and aggregating data delivered to monitoring tools. Anue’s Test and Measurement products emulate real world conditions in the lab to facilitate the testing and deployment of large networks. Founded in 2002, Anue’s customers include telecommunication and cable service providers, government agencies and corporations with large data centers and enterprise networks.
